

■SYSTEM AND COMMUNICATIONS PROTECTION IMPLEMENTATION EVIDENCE

Organization: Bumpass Fire & Rescue

Control: 3.13.4 - Shared Resource Protection

Prepared By: Mike Sadler, IT Coordinator | Date: 2026-07-10

1. SUMMARY

Evidence that Bumpass Fire & Rescue prevents unauthorized information transfer via shared resources.

2. VIRTUALIZATION ISOLATION

Platform: Azure (tenant: bumpassfire.org)

CUI virtual resources: Isolated in dedicated resource group with NSG

VM isolation: Hyper-V hypervisor provides hardware-level isolation between VMs

Windows 11 Endpoints (BFR-WS-001, WS-002):

- Virtualization-Based Security (VBS): Enabled
- Credential Guard: Enabled (protects credential data from userspace isolation bypass)
- Kernel DMA Protection: Enabled

3. SESSION ISOLATION

Temp directories: Cleared at logoff (GPO: ClearTempOnLogoff-Bumpass Fire & Rescue)

Browser: Microsoft Edge - separate session containers per security zone

Printer: Print Spooler restricted to Mike Sadler-managed printer; spool files cleared post-job

4. MEMORY PROTECTION

GPO: ASLR (Address Space Layout Randomization): Enabled

DEP (Data Execution Prevention): Enabled for all programs

Kernel Isolation: Enabled via VBS

5. QUARTERLY ISOLATION REVIEW

Date: 2026-06-30 | Reviewer: Mike Sadler

VBS status on BFR-WS-001: Enabled (confirmed in System Information > Device Security)

Credential Guard: Running

Temp clearing GPO: Applied and effective

Result: All shared resource protections operational.

6. CONCLUSION

Bumpass Fire & Rescue protects shared resources via VBS, Credential Guard, and session isolation policies per control 3.13.4.
